

### **Mutation**

### David E. Culler **CS88 – Computational Structures in Data Science**

http://inst.eecs.berkeley.edu/~cs88

Lecture 8

March 14, 2016

# **Computational Concepts Toolbox**

- Data type: values, literals, operations,
- Expressions, Call expression
- Variables
- Assignment Statement
- Sequences: tuple, list
- **Dictionaries**
- Data structures
- Tuple assignment
- Function Definition Statement

Conditional Statement Iteration: list comp, for, while

Lambda function expr.

- Higher Order Functions
  - Functions as Values
  - Functions with functions as argument
  - Assignment of function values
- Higher order function patterns
  - Map, Filter, Reduce
- Function factories create and return functions
- Recursion
  - Linear, Tail, Tree
- Abstract Data **Types**

UCB CS88 Sp16 L4

# **Objects**

- Objects represent information
- Consist of data and behavior, bundled together to create abstractions
  - Abstract Data Types
- They can have state
  - mutable vs immutable
- Object-oriented programming
  - A methodology for organizing large programs
  - So important it is supported in the language (classes)
- In Python, every value is an object
  - All objects have attributes
  - Manipulation happens through methods
- Functions do one thing (well)
  - Object do a collection of related things

- Maps project part I due today
  - Problems 0-6
  - Raise outstanding questions in lab
- Maps project part II due 3/30
- Lab06 is lighter, but due 3/18 (before break)
- HW05 is lighter, but due 3/28
- Midterm "breakthrough" opportunity
  - Offer to average midterm with retake (after break)
  - Must spend 1 hour with class staff working old MT this week
  - Tu 11-3 (tomorrow) with me, or during staff office hours

## Review: Dictionaries – by example

```
    Constructors:
```

```
- dict( hi=32, lo=17)
- dict([('hi',212),('lo',32),(17,3)])
- {'x':1, 'y':2, 3:4}
- {wd:len(wd) for wd in "The quick brown fox".split()}

• Selectors:
- water['lo']
- <dict>.keys(), .items(), .values()
- <dict>.get(key [, default] )
```

### Operations:

```
- in, not in, len, min, max
- 'lo' in water
```

### • Mutators

```
-water['lo'] = 33
```

2/22/16 UCB CS88 Sp16 L4

### **Dictionaries demo**

```
>>> phonebook["Lydia Lu"]
'707-341-1254'
>>> friends["Lydia Lu"]
KeyError: 'Lydia Lu'
>>> [1,2,3,4,5][7]
IndexError: list index out of range
>>> "Casey Casem" in friends
True
>>> friends["Lydia Lu"] if "Lydia Lu" in friends else "No key"
'No kev'
>>> friends.get("Lydia Lu", "No key")
>>> {x:y for (x,y) in friends}
ValueError: too many values to unpack (expected 2)
>>> {x:y for x,y in friends.items()}
>>> {name:[phonebook[friend] for friend in friend_list] for
name, friend list in friends.items()}
```

### **Dictionaries demo**

```
>>> phonebook = {"Christine Strauch": "510-842-9235",
            "Frances Catal Buloan": "932-567-3241",
            "Jack Chow": "617-547-0923",
            "Joy De Rosario": "310-912-6483",
            "Casey Casem": "415-432-9292",
            "Lydia Lu": "707-341-1254"}
. . .
friends = dict(
        [("Casey Casem", ['Christine Strauch', 'Jack Chow']),
         ("Christine Strauch", ['Jack Chow', 'Lydia Lu']),
         ("Frances Catal Buloan", ['Jack Chow']),
         ("Jack Chow", ['Christine Strauch', 'Frances Catal
Buloan']),
         ("Joy De Lydia", ['Jack Chow']),
. . .
         ("Joy De Rosario", ['Lydia Lu'])])
. . .
```

2/22/16 UCB CS88 Sp16 L4

### lambda

- Function expression
  - "anonymous" function creation
  - Expression, not a statement, no return or any other statement

### lambda <arg or arg\_tuple> : <expression using args>

```
inc = lambda v : v + 1

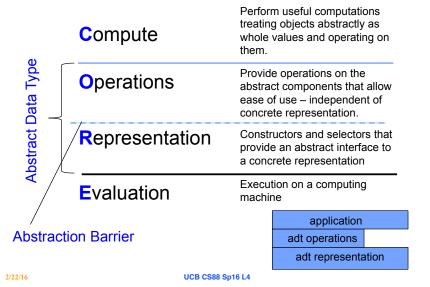

def inc(v):
    return v + 1

msort(friends.items(), lambda x:-len(x[1]))
```

## **Creating an Abtract Data Type**

- Operations
  - Express the behavior of objects, invariants, etc
  - Implemented (abstractly) in terms of Constructors and Selectors for the object
- Representation
  - Constructors & Selectors
  - Implement the structure of the object
- An abstraction barrier violation occurs when a part of the program that can use the higher level functions uses lower level ones instead
  - At either layer of abstraction
- Abstraction barriers make programs easier to get right, maintain, and modify
  - Few changes when representation changes

2/22/16 UCB CS88 Sp16 L4

# **Mutability**

- Immutable the value of the object cannot be changed
  - integers, floats, booleans
  - strings, tuples
- Mutable the value of the object
  - Lists
  - Dictionaries

```
>>> alist = [1,2,3,4]
>>> alist
[1, 2, 3, 4]
>>> alist[2]
3
>>> alist[2] = 'elephant'
>>> alist
[1, 2, 'elephant', 4]

>>> alist
[1, 2, 'elephant', 4]
```

### Are these 'mutation'?

10

```
def sum(seq):
    psum = 0
    for x in seq:
        psum = psum + x
    return psum

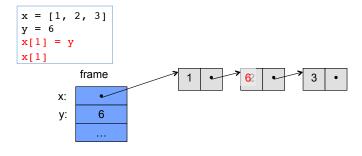

def reverse(seq):
    rev = []
    for x in seq:
        rev = [x] + rev
    return rev
```

2/22/16 UCB CS88 Sp16 L4 11 2/22/16 UCB CS88 Sp16 L4 12

### From value to storage ...

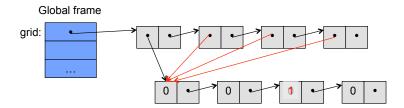

- A variable assigned a compound value (object) is a reference to that object.
- Mutable object can be changed but the variable(s) still refer to it

2/22/16 UCB CS88 Sp16 L4

13

# Sharing

# **Mutation makes sharing visible**

[[0, 0, 1, 0], [0, 0, 1, 0], [0, 0, 1, 0], [0, 0, 1, 0]]

2/22/16

UCB CS88 Sp16 L4

14

# Copies, 'is' and '=='

```
>>> alist = [1, 2, 3, 4]
>>> alist == [1, 2, 3, 4] # Equal values?
>>> alist is [1, 2, 3, 4] # same object?
False
>>> blist = alist
                           # assignment refers
>>> alist is blist
                           # to same object
>>> blist = list(alist)
                           # type constructors copy
>>> blist is alist
>>> blist = alist[ : ]
                           # so does slicing
>>> blist is alist
False
>>> blist
[1, 2, 3, 4]
```

2/22/16 UCB CS88 Sp16 L4 15 2/22/16 UCB CS88 Sp16 L4 16

## **Creating mutating 'functions'**

- Pure functions have referential transparency
- Result value depends only on the inputs
  - Same inputs, same result value
- · Functions that use global variables are not pure
- Higher order function returns embody state
- They can be "mutating"

2/22/16 UCB CS88 Sp16 L4

17

# **Creating mutating 'functions'**

```
counter +=1
                                             return counter
                                . . .
                                        return counts
                                . . .
                                . . .
  >>> counter = -1
                                >>> count fun = make counter()
                                >>> count fun()
  >>> def count fun():
           global counter
                                >>> count fun()
           counter += 1
           return counter
                                >>> nother_one = make_counter()
  >>> count fun()
                                >>> nother one()
                                >>> count fun()
  >>> count fun()
2/22/16
                             UCB CS88 Sp16 L4
```

>>> def make counter():

counter = -1

def counts():

nonlocal counter

# Creating mutable objects

Follow the ADT methodology, but enclose state within the abstraction

2/22/16

### **Useless bank account**

18

```
def account(name, initial_deposit):
    return (name, initial_deposit)

def account_name(acct):
    return acct[0]

def account_balance(acct):
    return acct[1]

def deposit(acct, amount):
    return (acct[0], acct[1]+amount)

def withdraw(acct, amount):
    return (acct[0], acct[1]-amount)
```

```
>>> my_acct = account('David Culler', 175)
>>> my_acct
('David Culler', 175)
>>> deposit(my_acct, 35)
('David Culler', 210)
>>> account_balance(my_acct)
175

UCB CS68 Sp16 L4
```

2/22/16 UCB CS88 Sp16 L4 19

### Bank account using dict

```
def account(name, initial deposit):
    return {'Name' : name, 'Number': 0,
             'Balance' : initial deposit}
def account name(acct):
    return acct['Name']
def account balance(acct):
    return acct['Balance']
                                  >>> my acct = account('David Culler', 93)
                                  >>> account balance(my acct)
def deposit(acct, amount):
    acct['Balance'] += amount >>> deposit(my_acct, 100)
    return acct['Balance']
                                  >>> account balance(my acct)
def withdraw(acct, amount):
                                  >>> withdraw(my acct, 10)
    acct['Balance'] -= amount
    return acct['Balance']
                                  >>> account balance(my acct)
                                  >>> your acct = account("Fred Jones",0)
                                  >>> deposit(your acct, 75)
                                  >>> account_balance(my_acct)
```
